

Create/Update/Delete/Query Messages
[HTTP GET/PUT/POST/DELETE]

Note:

Given all cache implementations are backed by their own CRUD repositories, technically there is no reason to have MessageStoreService and their own implementations and I could have moved MongoDB as another cache implementation. But as I started this project with MessageStores, I wanted to keep the flexibility of being able to add more of those later and just play with them via 'NoCache' implementation.
